Presentation Roadmap

01 **Research Question and Argument**
Motivation, answer, and economic logic

02 **Data, Measurement, and Empirical Design**
Sample, variables, baseline model, and identification

03 **First Principal Result**
Main estimates and the evidence that supports them

04 **Second Result or Main Extension**
Contrasting result, extension, or mechanism

05 **Contributions and Conclusion**
What the paper adds and what the evidence establishes

PART I

Research Question and Argument

State the question, answer, and economic logic.

Start with the research question

A clear question connects the motivation to the proposed idea.

What is difficult?

- Describe the concrete setting.
- Show why the current approach fails.
- State the condition that matters.

What changes?

- Introduce one central idea.
- Explain its intended benefit.
- Name the evidence needed to test it.

Research question

Can the proposed change improve the outcome under the same evaluation conditions?

Show the idea before the details

Explain the input, the key operation, and the output.

- Name the assumption that makes the operation meaningful.
- Use the next page to explain its essential mechanism.

PART II

Data, Measurement, and Empirical Design

Define the evidence and the estimating framework.

Explain the essential relationship

Define the symbols and conditions before interpreting the equation.

Objective

$$\theta^* = \arg\min_{\theta \in \Theta} \frac{1}{n} \sum_{i=1}^{n} \ell(f_\theta(x_i), y_i)$$

- n: number of training examples.
- ℓ: per-example loss.
- Θ: feasible parameter set.

Procedure sketch

1. Evaluate the current solution.
2. Update under the constraints.
3. Stop at the stated criterion.

An objective alone does not guarantee that an algorithm finds its global optimum.

State the baseline specification

Define the coefficient, variables, timing, and inference before reporting results.

$$Y_{i,t} = \beta T_{j,t-1} + \gamma' X_{i,t} + \delta' Z_{j,t} + \mu_i + \lambda_t + \varepsilon_{i,t}$$

Variables

- $Y_{i,t}$: define the outcome and unit.
- $T_{j,t-1}$: define the main regressor and timing.
- β: state the coefficient being interpreted.

Specification

- List every firm control used in the preferred model.
- List every industry or regional control.
- Name fixed effects, weights, and clustering level.

PART III

First Principal Result

Show the baseline estimate and the evidence that supports it.

Report gains and ties precisely

Synthetic example: +5 percentage points on A; a tie on B.

Task	Baseline (%)	Method (%)	Difference
A	50.0	**55.0****	+5.0 pp
B	40.0	40.0	Tied

All values here are **illustrative**, not experimental results.

- State the model, dataset split, budget, and metric direction.
- A relative gain of 10% on A differs from a gain of 5 pp.

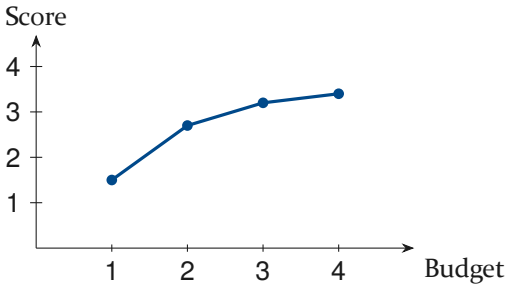

PART IV

Second Result or Main Extension

Develop the second result, mechanism, or countervailing effect.

Connect the figure to one observation

Synthetic example: more budget helps here, with smaller later gains.

Interpretation

- Point to the changing slope.
- Explain the cost of extra budget.
- Limit the conclusion to the observed range.

PART V

Contributions and Conclusion

Return to the question and state what the evidence adds.

Close the research story

Restate the contribution, the supporting evidence, and its boundary.

1. **Idea:** the one change the audience should remember.
2. **Evidence:** the observation that supports the claim.
3. **Boundary:** the conditions under which the claim holds.

Discussion

What additional evidence would make this conclusion stronger?

Discussion

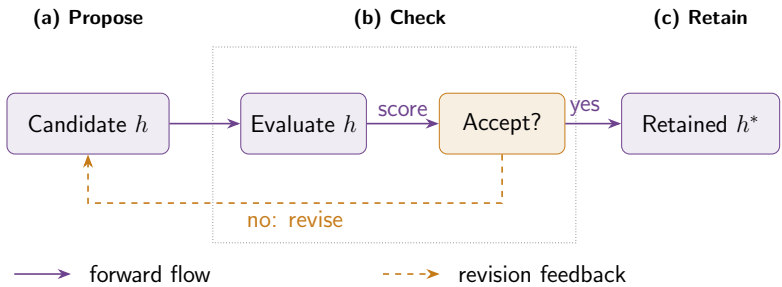

Return to the central question.

Thank you

Questions and discussion

Start with the complete original figure

Use the full view to connect the proposal, check, and retained output.

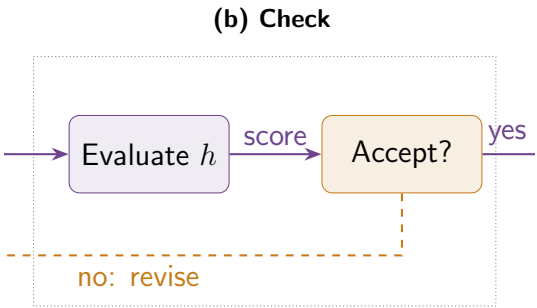

Read (a) → (b) → (c); follow the dashed feedback path. Panel (b) is enlarged next.

Source: self-created synthetic example, panels (a)–(c). Original vector asset; no measured results.

Explain a focused detail in context

Panel (b): evaluation precedes acceptance; rejection returns to proposal.

Locate panel (b) in the full view

1. Candidate h enters from panel (a).
2. Evaluation supplies the score to the acceptance decision.
3. The yes arrow leads to (c); the dashed path returns to (a).

Legend: solid purple = forward; dashed orange = feedback.

Source: self-created synthetic example, panel (b). Cropped from the preceding full view; explanation and legend repeated outside.
